EXERCISE 1.1 PAGE NO: 1.5**1. Add the following rational numbers:**

(i) $-5/7$ and $3/7$

(ii) $-15/4$ and $7/4$

(iii) $-8/11$ and $-4/11$

(iv) $6/13$ and $-9/13$

Solution:

Since the denominators are of same positive numbers we can add them directly

(i) $-5/7 + 3/7 = (-5+3)/7 = -2/7$

(ii) $-15/4 + 7/4 = (-15+7)/4 = -8/4$

Further dividing by 4 we get,

$-8/4 = -2$

(iii) $-8/11 + -4/11 = (-8 + (-4))/11 = (-8-4)/11 = -12/11$

(iv) $6/13 + -9/13 = (6 + (-9))/13 = (6-9)/13 = -3/13$

2. Add the following rational numbers:

(i) $3/4$ and $-5/8$

Solution: The denominators are 4 and 8

By taking LCM for 4 and 8 is 8

We rewrite the given fraction in order to get the same denominator

$3/4 = (3 \times 2) / (4 \times 2) = 6/8$ and

$-5/8 = (-5 \times 1) / (8 \times 1) = -5/8$

Since the denominators are same we can add them directly

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$6/8 + -5/8 = (6 + (-5))/8 = (6-5)/8 = 1/8$$

(ii) 5/-9 and 7/3

Solution: Firstly we need to convert the denominators to positive numbers.

$$5/-9 = (5 \times -1) / (-9 \times -1) = -5/9$$

The denominators are 9 and 3

By taking LCM for 9 and 3 is 9

We rewrite the given fraction in order to get the same denominator

$$-5/9 = (-5 \times 1) / (9 \times 1) = -5/9 \text{ and}$$

$$7/3 = (7 \times 3) / (3 \times 3) = 21/9$$

Since the denominators are same we can add them directly

$$-5/9 + 21/9 = (-5+21)/9 = 16/9$$

(iii) -3 and 3/5

EXERCISE 1.2 PAGE NO: 1.14

1. Verify commutativity of addition of rational numbers for each of the following pairs of rational numbers:

(i) $-\frac{11}{5}$ and $\frac{4}{7}$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

Solution: By using the commutativity law, the addition of rational numbers is commutative \therefore
 $a/b + c/d = c/d + a/b$

In order to verify the above property let us consider the given fraction

$-11/5$ and $4/7$ as

$-11/5 + 4/7$ and $4/7 + -11/5$

The denominators are 5 and 7

By taking LCM for 5 and 7 is 35

We rewrite the given fraction in order to get the same denominator

$$\text{Now, } -11/5 = (-11 \times 7) / (5 \times 7) = -77/35$$

$$4/7 = (4 \times 5) / (7 \times 5) = 20/35$$

Since the denominators are same we can add them directly

$$-77/35 + 20/35 = (-77+20)/35 = -57/35$$

$$4/7 + -11/5$$

The denominators are 7 and 5

By taking LCM for 7 and 5 is 35

We rewrite the given fraction in order to get the same denominator

$$\text{Now, } 4/7 = (4 \times 5) / (7 \times 5) = 20/35$$

$$-11/5 = (-11 \times 7) / (5 \times 7) = -77/35$$

Since the denominators are same we can add them directly

$$20/35 + -77/35 = (20 + (-77))/35 = (20-77)/35 = -57/35$$

$\therefore -11/5 + 4/7 = 4/7 + -11/5$ is satisfied.

(ii) $4/9$ and $7/-12$

Solution: Firstly we need to convert the denominators to positive numbers.

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$7/-12 = (7 \times -1) / (-12 \times -1) = -7/12$$

By using the commutativity law, the addition of rational numbers is commutative.

$$\therefore a/b + c/d = c/d + a/b$$

In order to verify the above property let us consider the given fraction

$4/9$ and $-7/12$ as

$$4/9 + -7/12 \text{ and } -7/12 + 4/9$$

$$\text{Now, } 4/9 = (4 \times 4) / (9 \times 4) = 16/36$$

$$-7/12 = (-7 \times 3) / (12 \times 3) = -21/36$$

Since the denominators are same we can add them directly

$$16/36 + (-21)/36 = (16 + (-21))/36 = (16-21)/36 = -5/36$$

$$-7/12 + 4/9$$

The denominators are 12 and 9

By taking LCM for 12 and 9 is 36

We rewrite the given fraction in order to get the same denominator

$$\text{Now, } -7/12 = (-7 \times 3) / (12 \times 3) = -21/36$$

$$4/9 = (4 \times 4) / (9 \times 4) = 16/36$$

Since the denominators are same we can add them directly

$$-21/36 + 16/36 = (-21 + 16)/36 = -5/36$$

$$\therefore 4/9 + -7/12 = -7/12 + 4/9 \text{ is satisfied.}$$

$$\frac{2}{15} = \frac{(2 \times 1)}{(15 \times 1)} = \frac{2}{15}$$

Since the denominators are same we can add them directly

$$-\frac{9}{15} + \frac{2}{15} = \frac{-9 + 2}{15} = -\frac{7}{15}$$

$$-\frac{2}{-15} + -\frac{3}{5}$$

$$-\frac{2}{-15} = \frac{2}{15}$$

The denominators are 15 and 5

By taking LCM for 15 and 5 is 15

We rewrite the given fraction in order to get the same denominator

$$\text{Now, } \frac{2}{15} = \frac{(2 \times 1)}{(15 \times 1)} = \frac{2}{15}$$

$$-\frac{3}{5} = \frac{-3 \times 3}{(5 \times 3)} = -\frac{9}{15}$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

Since the denominators are same we can add them directly

$$-12/35 + -2/7$$

The denominators are 35 and 7

By taking LCM for 35 and 7 is 35

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$\therefore -4/1 + -4/7 = -4/7 + -4/1$ is satisfied.

2. Verify associativity of addition of rational numbers i.e., $(x + y) + z = x + (y + z)$, when:

(i) $x = 1/2, y = 2/3, z = -1/5$

Solution: As the property states $(x + y) + z = x + (y + z)$

Use the values as such,

$$(1/2 + 2/3) + (-1/5) = 1/2 + (2/3 + (-1/5))$$

Let us consider LHS $(1/2 + 2/3) + (-1/5)$

$$35/30 + (-6)/30$$

Since the denominators are same we can add them directly,

$$(35+(-6))/30 = (35-6)/30 = 29/30$$

Let us consider RHS $1/2 + (2/3 + (-1/5))$

Taking LCM for 3 and 5 is 15

$$(2/3 + (-1/5)) = (2 \times 5)/(3 \times 5) + (-1 \times 3)/(5 \times 3)$$

$$= 10/15 + (-3)/15$$

Since the denominators are same we can add them directly,

$$10/15 + (-3)/15 = (10-3)/15 = 7/15$$

$$1/2 + 7/15$$

Taking LCM for 2 and 15 is 30

$$1/2 + 7/15 = (1 \times 15)/(2 \times 15) + (7 \times 2)/(15 \times 2)$$

$$= 15/30 + 14/30$$

Since the denominators are same we can add them directly,

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$= -44/110 + (-15)/110$$

Since the denominators are same we can add them directly,

$$-44/110 + (-15)/110 = (-44-15)/110 = -59/110$$

$$-7/11 + -59/110$$

3. The sum of the two numbers is $5/9$. If one of the numbers is $1/3$, find the other.

Solution: Let us note down the given details

Sum of two numbers = $5/9$

One of the number = $1/3$

By using the formula,

Other number = sum of number – given number

$$= 5/9 - 1/3$$

By taking LCM for 9 and 3 which is 9

$$5/9 - 1/3 = (5 \times 1 - 1 \times 3)/9$$

$$= (5 - 3)/9$$

Solution: Let us note down the given details

$$\text{Sum of two numbers} = -1/3$$

$$\text{One of the number} = -12/3$$

By using the formula,

$$\text{Other number} = \text{sum of number} - \text{given number}$$

$$\text{Sum of two numbers} = -4/3$$

$$\text{One of the number} = -5/1$$

By using the formula,

$$\text{Other number} = \text{sum of number} - \text{given number}$$

$$= -4/3 - -5/1$$

By taking LCM for 3 and 1 which is 3

$$-4/3 - -5/1 = (-4 \times 1 - -5 \times 3)/3$$

$$= (-4 + 15)/3$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$= 11/3$$

∴ the other number is 11/3

6. The sum of the two rational numbers is -8. If one of the numbers is -15/7, find the other.

Solution: Let us note down the given details

Sum of two rational numbers = -8/1

One of the number = -15/7

Let us consider the other number as x

$$x + -15/7 = -8$$

$$(7x - 15)/7 = -8$$

$$7x - 15 = -8 \times 7$$

$$7x - 15 = -56$$

$$7x = -56 + 15$$

$$x = -41/7$$

∴ the other number is -41/7

7. What should be added to -7/8 so as to get 5/9?

Solution: Let us consider a number as x to be added to -7/8 to get 5/9

$$\text{So, } -7/8 + x = 5/9$$

$$(-7 + 8x)/8 = 5/9$$

$$(-7 + 8x) \times 9 = 5 \times 8$$

$$-63 + 72x = 40$$

$$72x = 40 + 63$$

$$x = 103/72$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

∴ the required number is $103/72$

8. What number should be added to $-5/11$ so as to get $26/33$?

Solution: Let us consider a number as x to be added to $-5/11$ to get $26/33$

$$\text{So, } -5/11 + x = 26/33$$

$$x = 26/33 + 5/11$$

let us take LCM for 33 and 11 which is 33

$$x = (26 \times 1 + 5 \times 3)/33$$

$$= (26 + 15)/33$$

$$= 41/33$$

∴ the required number is $41/33$

9. What number should be added to $-5/7$ to get $-2/3$?

Solution: Let us consider a number as x to be added to $-5/7$ to get $-2/3$

$$\text{So, } -5/7 + x = -2/3$$

$$x = -2/3 + 5/7$$

let us take LCM for 3 and 7 which is 21

$$x = (-2 \times 7 + 5 \times 3)/21$$

$$= (-14 + 15)/21$$

$$= 1/21$$

∴ the required number is $1/21$

10. What number should be subtracted from $-5/3$ to get $5/6$?

Solution: Let us consider a number as x to be subtracted from $-5/3$ to get $5/6$

$$\text{So, } -5/3 - x = 5/6$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$x = -5/3 - 5/6$$

let us take LCM for 3 and 6 which is 6

$$x = (-5 \times 2 - 5 \times 1)/6$$

$$= (-10 - 5)/6$$

$$= -15/6$$

Further we can divide by 3 we get,

$$-15/6 = -5/2$$

∴ the required number is $-5/2$

11. What number should be subtracted from $3/7$ to get $5/4$?

Solution: Let us consider a number as x to be subtracted from $3/7$ to get $5/4$

$$\text{So, } 3/7 - x = 5/4$$

$$x = 3/7 - 5/4$$

let us take LCM for 7 and 4 which is 28

$$x = (3 \times 4 - 5 \times 7)/28$$

$$= (12 - 35)/28$$

$$= -23/28$$

∴ the required number is $-23/28$

12. What should be added to $(2/3 + 3/5)$ to get $-2/15$?

Solution: Let us consider a number as x to be added to $(2/3 + 3/5)$ to get $-2/15$

$$x + (2/3 + 3/5) = -2/15$$

By taking LCM of 3 and 5 which is 15 we get,

$$(15x + 2 \times 5 + 3 \times 3)/15 = -2/15$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$15x + 10 + 9 = -2$$

$$15x = -2-19$$

$$x = -21/15$$

Further we can divide by 3 we get,

$$-21/15 = -7/5$$

∴ the required number is $-7/5$

13. What should be added to $(1/2 + 1/3 + 1/5)$ to get 3?

Solution: Let us consider a number as x to be added to $(1/2 + 1/3 + 1/5)$ to get 3

$$x + (1/2 + 1/3 + 1/5) = 3$$

By taking LCM of 2, 3 and 5 which is 30 we get,

$$(30x + 1 \times 15 + 1 \times 10 + 1 \times 6) / 30 = 3$$

$$30x + 15 + 10 + 6 = 3 \times 30$$

$$30x + 31 = 90$$

$$30x = 90-31$$

$$x = 59/30$$

∴ the required number is $59/30$

14. What number should be subtracted from $(3/4 - 2/3)$ to get $-1/6$?

Solution: Let us consider a number as x to be subtracted from $(3/4 - 2/3)$ to get $-1/6$

$$\text{So, } (3/4 - 2/3) - x = -1/6$$

$$x = 3/4 - 2/3 + 1/6$$

Let us take LCM for 4 and 3 which is 12

$$x = (3 \times 3 - 2 \times 4) / 12 + 1/6$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$= (9 - 8)/12 + 1/6$$

$$= 1/12 + 1/6$$

Let us take LCM for 12 and 6 which is 12

$$= (1 \times 1 + 1 \times 2)/12$$

$$= 3/12$$

Further we can divide by 3 we get,

One of the number = $-4/15$

∴ other number is obtained by dividing the product by the given number.

$$\text{Other number} = (-8/9)/(-4/15)$$

$$= (-8/9) \times (15/-4)$$

10. The cost of 723723 meters of rope is Rs $12 \frac{3}{4}$. Find the cost per meter.

Solution:

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

We know that $2\frac{3}{3}$ meters of rope = Rs $5\frac{1}{4}$

Let us consider a number = x

$$\text{So, } x \times 2\frac{3}{3} = 5\frac{1}{4}$$

$$x = (5\frac{1}{4}) / (2\frac{3}{3})$$

$$x = (5\frac{1}{4}) \times (\frac{3}{23})$$

$$= (51 \times 3) / (4 \times 23)$$

$$= 153/92$$

$$= 1619216192$$

\therefore cost per meter is Rs 1619216192

11. The cost of 213213 meters of cloth is Rs $75\frac{1}{4}$. Find the cost of cloth per meter.

Solution:

We know that $7/3$ meters of cloth = Rs $30\frac{1}{4}$

Let us consider a number = x

$$\text{So, } x \times 7/3 = 30\frac{1}{4}$$

$$x = (30\frac{1}{4}) / (7/3)$$

$$x = (30\frac{1}{4}) \times (\frac{3}{7})$$

$$= (301 \times 3) / (4 \times 7)$$

$$= (43 \times 3) / (4 \times 1)$$

$$= 129/4$$

$$= 32.25$$

\therefore cost of cloth per meter is Rs 32.25

12. By what number should $-33/16$ be divided to get $-11/4$?

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

Solution:

Let us consider a number = x

$$\text{So, } (-33/16)/x = -11/4$$

$$-33/16 = x \times -11/4$$

$$x = (-33/16) / (-11/4)$$

$$= (-33/16) \times (4/-11)$$

$$= (-33 \times 4)/(16 \times -11)$$

$$= (-3 \times 1)/(4 \times -1)$$

$$= 3/4$$

13. Divide the sum of $-13/5$ and $12/7$ by the product of $-31/7$ and $-1/2$.

Solution:

sum of $-13/5$ and $12/7$

$$-13/5 + 12/7$$

$$((-13 \times 7) + (12 \times 5))/35$$

$$(-91+60)/35$$

$$-31/35$$

Product of $-31/7$ and $-1/2$

$$-31/7 \times -1/2$$

$$(-31 \times -1)/(7 \times 2)$$

$$31/14$$

\therefore by dividing the sum and the product we get,

$$(-31/35) / (31/14)$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$(-31/35) \times (14/31)$$

$$(-31 \times 14)/(35 \times 31)$$

$$-14/35$$

$$-2/5$$

14. Divide the sum of $65/12$ and $12/7$ by their difference.

Solution:

The sum is $65/12 + 12/7$

The difference is $65/12 - 12/7$

When we divide, $(65/12 + 12/7) / (65/12 - 12/7)$

$$((65 \times 7 + 12 \times 12)/84) / ((65 \times 7 - 12 \times 12)/84)$$

$$((455 + 144)/84) / ((455 - 144)/84)$$

$$(599/84) / (311/84)$$

$$599/84 \times 84/311$$

$$599/311$$

15. If 24 trousers of equal size can be prepared in 54 meters of cloth, what length of cloth is required for each trouser?

Solution:

We know that total number trousers = 24

Total length of the cloth = 54

Length of the cloth required for each trouser = total length of the cloth/number of trousers

$$= 54/24$$

$$= 9/4$$

\therefore 9/4 meters is required for each trouser.

EXERCISE 1.8 PAGE NO: 1.43

1. Find a rational number between -3 and 1.

Solution:

Let us consider two rational numbers x and y

We know that between two rational numbers x and y where $x < y$ there is a rational number $(x+y)/2$

$$x < (x+y)/2 < y$$

$$(-3+1)/2 = -2/2 = -1$$

So, the rational number between -3 and 1 is -1

$$\therefore -3 < -1 < 1$$

2. Find any five rational numbers less than 2.

Solution:

Five rational numbers less than 2 are 0, $1/5$, $2/5$, $3/5$, $4/5$

3. Find two rational numbers between $-2/9$ and $5/9$

Solution:

The rational numbers between $-2/9$ and $5/9$ is

$$(-2/9 + 5/9)/2$$

$$(1/3)/2$$

$$1/6$$

The rational numbers between $-2/9$ and $1/6$ is

$$(-2/9 + 1/6)/2$$

$$((-2 \times 2 + 1 \times 3)/18)/2$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$(-4+3)/36$$

$$-1/36$$

∴ the rational numbers between $-2/9$ and $5/9$ are $-1/36, 1/6$

4. Find two rational numbers between $1/5$ and $1/2$

Solution:

The rational numbers between $1/5$ and $1/2$ is

$$(1/5 + 1/2)/2$$

$$((1 \times 2 + 1 \times 5)/10)/2$$

$$(2+5)/20 = 7/20$$

The rational numbers between $1/5$ and $7/20$ is

$$(1/5 + 7/20)/2$$

$$((1 \times 4 + 7 \times 1)/20)/2$$

$$(4+7)/40$$

$$11/40$$

∴ the rational numbers between $1/5$ and $1/2$ are $7/20, 11/40$

5. Find ten rational numbers between $1/4$ and $1/2$.

Solution:

Firstly convert the given rational numbers into equivalent rational numbers with same denominators.

The LCM for 4 and 2 is 4.

$$1/4 = 1/4$$

$$1/2 = (1 \times 2)/4 = 2/4$$

$$1/4 = (1 \times 20 / 4 \times 20) = 20/80$$

<https://www.indcareer.com/schools/rd-sharma-solutions-for-class-8-maths-chapter-1-rational-numbers/>

$$1/2 = (2 \times 20 / 4 \times 20) = 40/80$$

So, we now know that 21, 22, 23, ... 39 are integers between numerators 20 and 40.

∴ the rational numbers between $1/4$ and $1/2$ are $21/80, 22/80, 23/80, \dots, 39/80$

6. Find ten rational numbers between $-2/5$ and $1/2$.

Solution:

Firstly convert the given rational numbers into equivalent rational numbers with same denominators.

The LCM for 5 and 2 is 10.

$$-2/5 = (-2 \times 2) / 10 = -4/10$$

$$1/2 = (1 \times 5) / 10 = 5/10$$

$$-2/5 = (-4 \times 2 / 10 \times 2) = -8/20$$

$$1/2 = (5 \times 2 / 10 \times 2) = 10/20$$

So, we now know that -7, -6, -5, ... 10 are integers between numerators -8 and 10.

∴ the rational numbers between $-2/5$ and $1/2$ are $-7/20, -6/20, -5/20, \dots, 9/20$

7. Find ten rational numbers between $3/5$ and $3/4$.

Solution:

Firstly convert the given rational numbers into equivalent rational numbers with same denominators.

The LCM for 5 and 4 is 20.

$$3/5 = 3 \times 4 / 5 \times 4 = 12/20$$

$$3/4 = 3 \times 5 / 4 \times 5 = 15/20$$

So, we now know that 13, 14, 15, ... 19 are integers between numerators 12 and 15.

∴ the rational numbers between $3/5$ and $3/4$ are $13/20, 14/20, 15/20, \dots, 19/20$

About RD Sharma

RD Sharma isn't the kind of author you'd bump into at lit fests. But his bestselling books have helped many CBSE students lose their dread of maths. Sunday Times profiles the tutor turned internet star

He dreams of algorithms that would give most people nightmares. And, spends every waking hour thinking of ways to explain concepts like 'series solution of linear differential equations'. Meet Dr Ravi Dutt Sharma — mathematics teacher and author of 25 reference books — whose name evokes as much awe as the subject he teaches. And though students have used his thick tomes for the last 31 years to ace the dreaded maths exam, it's only recently that a spoof video turned the tutor into a YouTube star.

R D Sharma had a good laugh but said he shared little with his on-screen persona except for the love for maths. "I like to spend all my time thinking and writing about maths problems. I find it relaxing," he says. When he is not writing books explaining mathematical concepts for classes 6 to 12 and engineering students, Sharma is busy dispensing his duty as vice-principal and head of department of science and humanities at Delhi government's Guru Nanak Dev Institute of Technology.
