Maharashtra Board Solutions Class 12 Biology: Chapter 14- Ecosystems and Energy Flow

Class 12: Biology Chapter 14 solutions. Complete Class 12 Biology Chapter 14 Notes.

Maharashtra Board Solutions Class 12 Biology: Chapter 14- Ecosystems and Energy Flow

Maharashtra Board 12th Biology Chapter 14, Class 12 Biology Chapter 14 solutions

1. Multiple choice questions

Question 1.

Which one of the following has the largest population in a food chain?

- (a) Producers
- (b) Primary consumers
- (c) Secondary consumers
- (d) Decomposers

Answer:

- (a) Producers

Question 2.

The second trophic level in a lake is

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

- (a) Phytoplankton
- (b) Zooplankton
- (c) Benthos
- (d) Fishes

Answer:

- (b) Zooplankton

Question 3.

Secondary consumers are

- (a) Herbivores
- (b) Producers
- (c) Carnivores
- (d) Autotrophs

Answer:

- (c) Carnivores

Question 4.

What is the % of photosynthetically active radiation in the incident solar radiation?

- (a) 100%
- (b) 50%
- (c) 1-5%
- (d) 2-10%

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

Answer:

(b) 50%

Question 5.

Give the term used to express a community in its final stage of succession?

- (a) End community
- (b) Final community
- (c) Climax community
- (d) Dark community

Answer:

(c) Climax community

Question 6.

After landslide which of the following type of succession occurs?

- (a) Primary
- (b) Secondary
- (c) Tertiary
- (d) Climax

Answer:

(a) Primary

Question 7.

Which of the following is most often a limiting factor of the primary productivity in any ecosystem?

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

- (a) Carbon
- (b) Nitrogen
- (c) Phosphorus
- (d) Sulphur

Answer:

- (c) Phosphorus

2. Very short answer question.

Question 1.

Give an example of ecosystem which shows inverted pyramid of numbers.

Answer:

Number of insects dependent on a single tree, is an example of ecosystem having inverted pyramid of numbers.

Question 2.

Give an example of ecosystem which shows inverted pyramid of biomass.

Answer:

Oceanic ecosystem has inverted pyramid of biomass.

Question 3.

Which mineral acts as limiting factor for productivity in an aquatic ecosystem?

Answer:

Phosphorus acts as limiting factor for productivity in an aquatic ecosystem.

Question 4.

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

Name the reservoir and sink of carbon in carbon cycle.

Answer:

Atmosphere is the reservoir of carbon cycle, while fossil fuels embedded in ocean and oceanic waters are the sink of carbon in carbon cycle.

3. Short answer questions.

Question 1.

Upright and inverted pyramid of biomass.

Answer:

Upright pyramid

1. In upright pyramid, the number and biomass of the organisms which are at first trophic level of producers is high.

2. The biomass goes on decreasing at each trophic level.

3. The base of the pyramid is always in large number of producers.

4. Pyramid is always upright.

Inverted pyramid

1. In inverted pyramid, the number and biomass of organisms at first trophic levels of producers is lowest.

2. The biomass goes on increasing at each trophic level.

3. The base of pyramid is always in small numbers of producers.

4. Pyramid is always inverted.

Question 2.

Food chain and Food web.

Answer:

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

Food chain

1. Food chain is the linear sequence of organisms for feeding purpose.
2. In food chain the flow of energy is through a single straight pathway from the lower trophic level to the higher trophic level.
3. In a food chain, members present at higher trophic level feeds on only single type of organisms.
4. Energy flow can be easily calculated in food chain.
5. In food chain there is increased instability due to increasing number of separate and confined food chains.
6. The whole food chain gets affected even if one group of an organism is disturbed.
7. Member of higher trophic level depends or feed upon the single type of organisms of the lower trophic level.
8. Food chain consists of only 4-6 trophic levels of different species.

Food web

1. Food web is interconnections between many small food chains.
2. In food web, the energy flow is interconnected through numerous food chains in the ecosystem.
3. In a food web, one organism can feed on multiple types of organisms.
4. Energy flow is difficult to calculate in a food web.
5. In food web there is increased stability due to the presence of the complex food chains.
6. The food web does not get disturbed by the removal of one group of organisms.
7. The members of higher trophic level depend or feed upon many different types of the organism of the lower trophic level.
8. Food web contains numerous trophic levels and also of different populations of species.

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

9. Competition is seen in members of same trophic level.

9. Competition is seen in members of same as well as different trophic levels.

10. Food chains are of two types: 1. Grazing food chain 2. Detritus food chain.

10. In food web there are no types.

4. Long answer questions

Question 1.

Define ecological pyramids and describe with examples, pyramids of number and biomass.

Answer:

1. Ecological Pyramids : Ecological Pyramids are the representation of relationships between different components of ecosystem at successive trophic levels.

2. Pyramid of numbers:

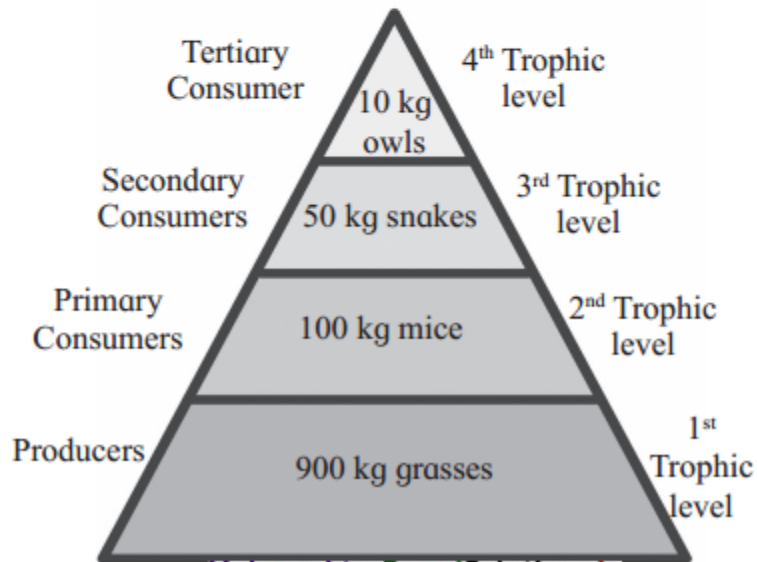

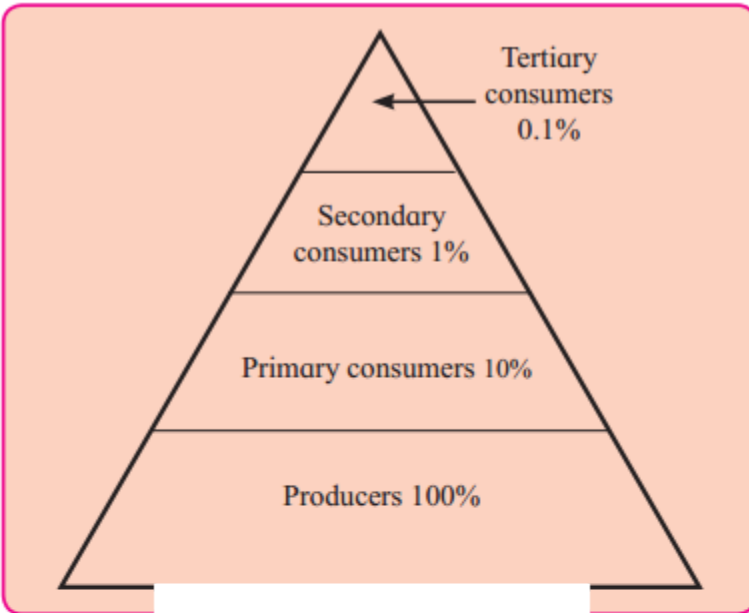

- Pyramid of numbers is the diagrammatic representation which shows the relationship between producers, herbivores and carnivores at successive trophic levels in terms of their numbers.
- As we go up the trophic levels, the interdependent organisms keep on reducing in their numbers.
- For example, the number of grasses are more than the number of herbivores which eat them. The number of herbivores such as rabbits would be lesser than grass but greater than the carnivores that are dependent upon the population of rabbits.
- Thus, the producers would be more than primary consumers and primary consumers would be more than secondary consumers. The top level consumers would be least in their numbers. This pyramid shows upright nature.

3. Pyramid of biomass:

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

(1) Pyramid of biomass are constructed by taking into consideration the different biomass in every successive trophic level.

(2) Pyramid of biomass in seas is inverted as the biomass of fishes is more than the biomass of phytoplankton.

Question 2.

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

What is primary productivity? Give brief description of factors that affect primary productivity.

Answer:

(1) Primary Productivity : The rate of generation of biomass in an ecosystem which is expressed in units of mass per unit surface (or volume) per unit time, for instance grams per square metre per day ($\text{g/m}^2/\text{day}$) is called primary productivity.

(2) Primary productivity is described as gross primary productivity (GPP) and net primary productivity (NPP).

(3) The rate of production of organic matter during photosynthesis is called gross primary productivity of an ecosystem. Of this the amount of energy lost through respiration of plants is called respiratory losses.

(4) Gross primary productivity minus respiratory losses gives the net primary productivity (NPP).

(5) Net primary productivity is the available biomass for the consumption to heterotrophs (herbivores, carnivores and decomposers).

(6) Factors affecting primary productivity: Gross primary productivity (GPP) depends on the following factors:

- Plant species inhabiting a particular area.
- Variety of environmental factors such as temperature, sunlight, salinity, oxygen and carbon dioxide content, etc.
- Availability of nutrients and
- Photosynthetic capacity of plants.

Question 3.

Define decomposition and describe the processes and products of decomposition.

Answer:

1. Decomposition is the process carried out by the decomposer organisms.

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

2. Most of the bacteria, actinomycetes and fungi are decomposers. They convert the dead and decaying organic matter into simpler compounds. These simpler inorganic substances return back to the environment.
3. Decomposition takes place through detritus food chain. It starts from the dead organic matter. Detritus eating organisms called detritivores like earthworm, etc. breakdown the detritus into smaller fragments. Therefore, this first step of decomposition is called fragmentation.
4. Water soluble inorganic nutrients seep into the soil after fragmentation. These nutrients get precipitated as salts. Therefore, this second step of decomposition is called leaching.
5. The third step of decomposition is called catabolism. In this step, fungal and bacterial enzymes degrade the detritus into simple inorganic substances.
6. The partially decomposed organic matter is called humus which is formed by the process of humification. Humus is a dark coloured amorphous substance which is the reservoir of nutrients.
7. Humus too undergoes decomposition by bacterial action at a very slow rate and ultimately releases inorganic matter. This process is therefore called mineralization.
8. Decomposition requires oxygen in greater amount. The rate of decomposition is dependent upon the temperature and the humidity of the environment.

Question 4.

Write important features of a sedimentary cycle in an ecosystem.

Answer:

1. Reservoir of sedimentary cycles is earth's crust.
2. The nutrients such as phosphorus which show sedimentary cycle, moves through hydrosphere, lithosphere and biosphere.
3. There is no respiratory release of nutrients into the atmosphere which show sedimentary cycle.
4. Natural reservoir of such nutrients are usually in the form of rocks. The rocks upon weathering release such nutrients into circulation.
5. Sedimentary cycles are very slow in their reactions.

Question 5.

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

Describe carbon cycle and add a note on the impact of human activities on carbon cycle.

Answer:

I. Carbon cycle:

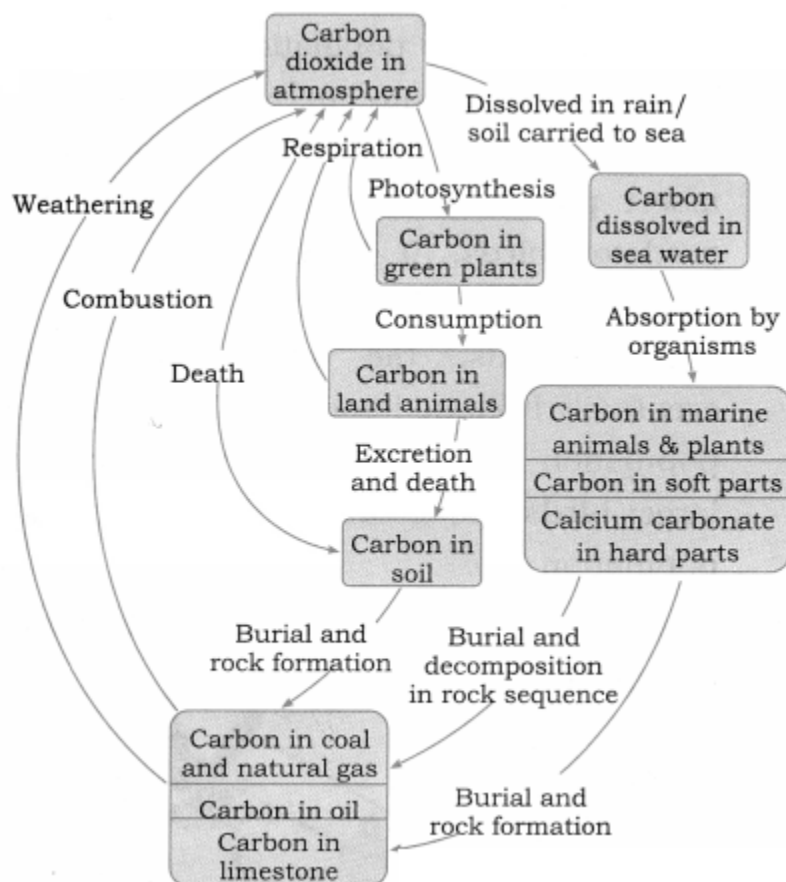

- (1) The entire carbon cycle has following basic processes viz. Photosynthesis, Respiration, Decomposition, Sedimentation and Combustion.
- (2) Carbon is an important element as it forms 49% of the dry weight of all organisms. 71% of global carbon is present in the oceans. Therefore, ocean is the major reservoir of carbon. Carbon is also present in all fossil fuels. This is long term storage places or sinks for carbon which is in the form of coal, natural gas, etc.
- (3) Respiration and photosynthesis are the two events that keep the carbon in cyclic circulation. During respiration, oxygen is used for combustion of carbohydrates as a result of which carbon dioxide and water are formed with the release of energy. The process of photosynthesis utilizes carbon dioxide and water vapour liberating oxygen and producing carbohydrates at the same time.
- (4) Solar energy is stored in the carbon-carbon bonds of carbohydrates during photosynthesis whereas respiration releases the same stored energy.
- (5) The main reservoirs for carbon dioxide are in the oceans and in rocks. Carbon dioxide is highly soluble in water and forms mild carbonic acid upon dissolving. This dissolved carbon dioxide precipitate as a solid rock or limestone which is calcium carbonate. This reaction in the seas is aided by corals and algae which in turn builds the coral reefs made up of limestone.
- (6) Carbon moves through food chains. Autotrophic green plants on land and in water take up carbon dioxide and manufacture carbohydrates by the process of photosynthesis. The carbon stored in plants has three different fates, viz. liberation into atmosphere, consumption by animals upon feeding, storage in the plant till the plant dies.
- (7) Animals get their carbon requirement through their food. When autotrophs are consumed, the heterotrophs obtain carbon. Carbon in animals also has three fates, viz. release back into the atmosphere in the process of respiration, release of stored carbon

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

from the body by the action of decomposers or conversion into fossil fuels if buried intact.

(8) Fossil fuels such as coal, oil, natural gas, etc. can be mined and burned for energy purposes. This burning releases carbon dioxide back into the atmosphere.

(9) Carbon from limestone can also be released if pushed to the surfaces and slowly weathered away. Subducting and volcanic eruptions can also release the stored carbon from sediments.

II. Impact of human activities on carbon cycle:

(1) Excessive burning of fossil fuels for power plants, industrial processes and vehicular traffic, adds excessive carbon dioxide into atmosphere. When fossil fuels burn

<https://www.indcareer.com/schools/maharashtra-board-solutions-class-12-biology-chapter-14-ecosystems-and-energy-flow/>

to run factories, power plants, motor vehicles, most of the carbon quickly enters the atmosphere as carbon dioxide gas.

(2) Each year, 5.5 billion tonnes of carbon is released through combustion of fossil fuels. Of this massive amount, 3.3 billion tonnes stays in the atmosphere.

(3) Rapid deforestation also increases carbon dioxide. Since plants absorb carbon dioxide for their photosynthesis, they always reduce the concentration of CO₂. But deforestation upsets this balance.

(4) Massive burning of fossil fuel for energy and transport, have significantly increased the rate of release of carbon dioxide into the atmosphere which is causing global warming and resultant climate change.

Maharashtra Board Solutions

Class 12 Biology

- Chapter 1- Reproduction in Lower and Higher Plants
- Chapter 2- Reproduction in Lower and Higher Animals
- Chapter 3- Inheritance and Variation
- Chapter 4- Molecular Basis of Inheritance
- Chapter 5- Origin and Evolution of Life
- Chapter 6- Plant Water Relation
- Chapter 7- Plant Growth and Mineral Nutrition
- Chapter 8- Respiration and Circulation
- Chapter 9- Control and Co-ordination
- Chapter 10- Human Health and Diseases
- Chapter 11- Enhancement of Food Production
- Chapter 12- Biotechnology
- Chapter 13- Organisms and Populations
- Chapter 14- Ecosystems and Energy Flow
- Chapter 15- Biodiversity, Conservation and Environmental Issues

About About Maharashtra State Board (MSBSHSE)

The Maharashtra State Board of Secondary and Higher Secondary Education or MSBSHSE (Marathi: महाराष्ट्र राज्य माध्यमिक आणि उच्च माध्यमिक शिक्षण मंडळ), is an **autonomous and statutory body established in 1965**. The board was amended in the year 1977 under the provisions of the Maharashtra Act No. 41 of 1965.

The Maharashtra State Board of Secondary & Higher Secondary Education (MSBSHSE), Pune is an independent body of the Maharashtra Government. There are more than 1.4 million students that appear in the examination every year. The Maha State Board conducts the board examination twice a year. This board conducts the examination for SSC and HSC.

The Maharashtra government established the Maharashtra State Bureau of Textbook Production and Curriculum Research, also commonly referred to as Ebalbharati, in 1967 to take up the responsibility of providing quality textbooks to students from all classes studying under the Maharashtra State Board. MSBHSE prepares and updates the curriculum to provide holistic development for students. It is designed to tackle the difficulty in understanding the concepts with simple language with simple illustrations. Every year around 10 lakh students are enrolled in schools that are affiliated with the Maharashtra State Board.

FAQs

Where do I get the Maharashtra State Board Books PDF For free download?

You can download the Maharashtra State Board Books from the eBalbharti official website, i.e. cart.ebalbharati.in or from this article.

Add image

How to Download Maharashtra State Board Books?

Students can get the Maharashtra Books for primary, secondary, and senior secondary classes from here. You can view or download the Maharashtra State Board Books from this page or from the official website for free of cost. Students can follow the detailed steps below to visit the official website and download the e-books for all subjects or a specific subject in different mediums.

Step 1: Visit the official website ebalbharati.in

Step 2: On the top of the screen, select "Download PDF textbooks"

Step 3: From the "Classes" section, select your class.

Step 4: From "Medium", select the medium suitable to you.

Step 5: All Maharashtra board books for class 11th will now be displayed on the right side.

Step 6: Click on the "Download" option to download the PDF book.

Who developed the Maharashtra State board books?

As of now, the MSCERT and Balbharti are responsible for the syllabus and textbooks of Classes 1 to 8, while Classes 9 and 10 are under the Maharashtra State Board of Secondary and Higher Secondary Education (MSBSHSE).

How many state boards are there in Maharashtra?

The Maharashtra State Board of Secondary & Higher Secondary Education, conducts the HSC and SSC Examinations in the state of Maharashtra through its nine Divisional Boards located at Pune, Mumbai, Aurangabad, Nasik, Kolhapur, Amravati, Latur, Nagpur and Ratnagiri.
